

Campus IQ — FIT · Role Explorer

Ethan Brooks · Texas A&M University · Generated 2026-07

Your Role Matches

You're a freshman intending Computer Engineering, and your target roles line up unusually well with both your intended major and your stated interests. That's a strong signal this early — the work ahead is building readiness, not figuring out direction.

1. Embedded Systems Intern — strongest fit

Your interests in embedded systems, robotics, and computer hardware map directly onto this role, and it's a natural feeder into Computer Engineering. Embedded work sits right at the hardware-software boundary you've said you're drawn to.

Why it fits you: Your stated interests name this path almost exactly, and your engineering-computation foundation (ENGR 102, Python basics) is the right starting point for embedded development.

2. Software Engineering Intern — strong fit

The most abundant of your three targets in the Texas market. Your Python foundation and software-development interest support it, and it keeps the widest range of employers open to you.

Why it fits you: Software roles reward the computation and problem-solving skills you're already building, and the volume of openings means more entry points.

3. Computer Engineering Intern — strong fit

The broadest umbrella of your three targets — spans hardware, software, and systems. A good catch-all as you clarify which side of CpE pulls you most.

Why it fits you: It aligns with your intended major directly and doesn't force an early specialization.

Geographic Picture

All three roles are well represented across your preferred Texas metros — College Station, Austin, Dallas, and Houston. You don't face a location-vs-role tradeoff; your targets exist where you want to be.

What This Means

No fit problem here. Your direction is sound and your interests are coherent. The next question isn't *which roles* — it's *what you need to qualify for them*, which is what your Readiness Check (GAP) addresses.
